DETAILED ACTION

Response to Arguments

Applicant's amendment, filed August 18th, 2008, has overcome the rejection of claims 26-32 under 35 U.S.C. 112. The rejection of these claims has been withdrawn.

In light of the newly cited references, the reasons for allowance have been clarified below.

Allowable Subject Matter

Claims 17-29, 31, and 33-36 are allowed over the prior art of record.

The following is an examiner's statement of reasons for allowance:

As to claim 17, the prior art of record, taken alone or in combination, fails to disclose or render obvious a scanning microscope for imaging an object, comprising: a spectrally selective element **useable to select light** from the light source so as to illuminate the object, the spectrally selective element being **useable to mask out of the detection beam path the selected light** from the light source reflected or scattered on the object; an illumination slit diaphragm disposed in the illumination beam path and configured to generate a linear illumination pattern in a region of the object; and a spectral splitting device configured to spectrally split the light extending along the detection beam path so as to provide **spectrally split light including spatial information along a first direction and spectral information long a second direction**; wherein at least one of a slit length and a slit width of at least one of the illumination slit diaphragm and the detection slit diaphragm are variably settable, in combination with the rest of the limitations of claim 17.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Additional Prior Art

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. The prior art made of record is Englehardt et al. (US Pubs 2002/0180965 and US Pubs 2003/0006368).

Both Englehardt references disclose a scanning microscope for imaging an object, comprising: a light source; a spectrally selective detection device; an illumination beam path extending from the light source to the object; a detection beam path extending from the object to the detection device, at least one wavelength range of light extending along the detection beam path being detectable using the spectrally selective detection device; a beam splitter for directing the illumination beam path to the sample, and directing the detection beam path towards the detection device; an illumination diaphragm disposed in the illumination beam path and configured to generate a linear illumination pattern in a region of the object; and a detection slit diaphragm disposed in the detection beam path and configured to detect the light coming from the linear illumination region from a focal plane so as to provide a confocal slit scanner; wherein at least one of a slit length and a slit width of detection slit diaphragm are variably settable.
